Summary

Protocol engineer and developer advocate with two years of shipping onchain products and running developer programs. I co-founded Web3Spell Labs, where I lead engineering on audited DeFi and zero-knowledge projects, and I have organised 75+ developer events that reached more than 5,000 developers. I am looking for a developer relations or protocol engineering role in Singapore.

Achievements

- Won the TOKEN2049 Origins Hackathon in Singapore (2024)
- Received a $17,000 grant from Compound Protocol for ChainPot; the contracts were reviewed by Certora and every finding was fixed (remediation report)
- Community partner for TOKEN2049 Singapore 2025 and Consensus Hong Kong 2026
- Named to the Thrive Power List Top 500 (January 2026)
- Mentor or speaker at Paris Blockchain Week 2025, Arbitrum Ignite, GirlScript Summer of Code and Winter of Blockchain
- Wrote two guides on the Rootstock Developer Portal: LI.FI integration and x402 payments; my lending boilerplate is published in Rootstock's official GitHub

Experience

Web3Spell Labs, Co-Founder, Engineering and Developer Relations — May 2024 to present

- Lead engineering for a small studio building protocols on Solana, Base, Rootstock and Somnia, from contract design through testnet launch.
- Organised 75+ developer events reaching 5,000+ developers, including Arbitrum Ignite, a 12-day bootcamp for 250+ developers, and Core Nexus, a 36-hour hackathon with 150+ project submissions.
- Ran build stations for Solana and Mantra hackathons; teams from one Bhopal station submitted 40+ projects, and several went on to win grants.
- Host SpellCast, a podcast with protocol founders and DevRel leads about what they are building.

ChainPot, Founder and Lead Engineer — June 2025 to present

- Built a savings-circle (ROSCA) protocol on Base. Members pool USDC each cycle, and the payout goes to a Chainlink VRF draw or the lowest bidder in a discount auction.
- Idle funds earn yield on Compound III, and 20% of the interest goes to an insurance reserve.
- Funded by a $17,000 Compound grant. Took the seven-contract system through a Certora review, fixed all 21 findings, and verified the full stack on Base Sepolia with 48 of 48 Foundry tests passing (code).

Civitas, Co-Founder and Engineer — 2025 to August 2026

- Built private payroll on Solana. Salaries are stored as Nillion secret shares, and employees withdraw with Groth16 proofs that the program verifies onchain.
- Wrote the Anchor program and the web app, and routed payments through MagicBlock so amounts stay hidden. Shipped on devnet for the Colosseum Frontier Hackathon in April 2026 (code).

Freelance Developer Advocate, SNS, Oraichain, Push Protocol — 2023 to 2025

- Wrote tutorials and ran workshops that brought developers onto each ecosystem as an ambassador and advocate.

Selected Projects

- **Divergence Router** (Somnia, 2026): Trading router for the DreamDEX order book. It measures price divergence before each order and picks a maker order, a bounded IOC order, or a halt. Both legs of a paired contract fill in one transaction or the whole trade reverts. Solidity, ERC-6909, Viem. Code

- **Rootstock Paymaster Kit** (Rootstock, 2026): ERC-4337 v0.7 paymaster that lets users pay gas in ERC-20 tokens instead of RBTC, with an off-chain signing service. Verified on Rootstock testnet.
- **Liveness Vault** (Rootstock, 2026): Staking protocol where participants send heartbeats, and keepers can slash anyone who misses one. Foundry invariant tests with full coverage. Code
- **RBTC/USDT0 Lending Boilerplate** (Rootstock, 2026): Lending app where users deposit RBTC as collateral and borrow USDT0. Published in Rootstock's official GitHub organisation as a starter kit for developers.
- **Rootstock developer tools** (2026): Fee-Radar estimates peg-out costs to Bitcoin, and Permit-Wiz debugs gasless EIP-712 signatures. Built during the Rootstock Builder Rootcamp.
- **Swarm Broker** (2026): Payments between AI agents using the x402 protocol and EIP-2612 permits.
- **Labelo** (Initia, 2026): Marketplace that pays people onchain for labeling AI training data. Built for the DoraHacks INITIATE hackathon.

Skills

Smart contracts: Solidity, Foundry, Hardhat, Rust, Anchor, Chainlink VRF, Compound III, ERC-4337, ERC-6909

Zero knowledge and privacy: Circom, Groth16, snarkjs, Nillion, MagicBlock

Full stack: TypeScript, Next.js, React, Node.js, Viem, wagmi, PostgreSQL, MongoDB, Docker

Developer relations: tutorials and documentation, sample apps, workshops and bootcamps, hackathon design and judging, podcasting

Education

Diploma in Computer Science Engineering, Samrat Ashok Technological Institute (SATI), Vidisha 2022 to 2025

Certifications: Solana Development (Rust, Anchor), Narra8ive; Blockchain Development, Alchemy University

Languages: English (professional), Hindi (native)
